Ringkasan

I am a 5th-semester Electrical Engineering student at Universitas Sebelas Maret with a hands-on focus on Embedded AI, IoT, and hardware-software integration. I don't just learn about circuits in a classroom; I build real, working prototypes. My core strength lies in Edge AI optimization. Recently, I developed TinyDrowsy, an end-to-end real-time drowsiness detection system running on an ESP32-S3. By designing a lightweight 10.6K parameter CNN and quantizing it (FP32 to INT8), I achieved a 99.87% accuracy while maintaining low latency at 8.8 FPS and fitting into just 27.4KB of memory. Beyond embedded AI, I have a diverse technical toolkit, including C, Python, VHDL/Verilog, and Flutter, which I've used to build projects ranging from a mechanical Rice Transplanter machine to mobile app automation pipelines. My primary interest is leveraging these technologies to drive innovation in the Energy and Utilities sector. I am currently seeking internship opportunities, research assistantships, and collaborative projects in Embedded Systems, Machine Learning, and IoT. If you are working on something cool in these spaces, let's connect!
